Software production, governed on evidence

Decision need	Leadership decides about software investment, capacity, modernization and AI adoption across a portfolio that no single report describes. Status reports and tool dashboards give local signal, not a comparable management view.
What Seerene provides	The Digital Boardroom for Enterprise Software Production: one independent evidence base across cost, quality, capacity, risk and business value, built read-only from the toolchain teams already use, comparable across product lines, teams and partners, and traceable from every management figure to the system, the component and its change history — evidence at code level, without source code leaving your environment.
What becomes decidable	Where additional investment reaches the product and where it is absorbed; which systems carry structural risk for the business; what AI adoption has changed in production; whether allocation still matches strategy.
Evidence and trust	Engineering leads validate every interpretation before leadership decides. Team and system level only; no individual scoring or ranking. Research origin at the Hasso Plattner Institute; proof is the trace from figure to source.
What it asks of the organization	One executive sponsor with a decision to take; one engineering lead for validation; one technical contact for typically about 8 net working hours in total of read-only connection. No new tools, no workflow changes. Security review, procurement and works council alignment planned in parallel.
Your part	The executive who owns the question reads the answer every month: fifteen minutes with the direct reports, one verified view, three decisions — where are we off track, who acts next, what changes before the next review. The first four to six rounds are guided. The technical validation can be delegated; the decision cannot.
Perimeter	Several production lines that differ in technology and method, up to the whole software production, agreed in scoping. A single team cannot show the portfolio effect.
Day 30	An evidence review, not a contractual exit: findings validated by engineering, three to five proposed actions with owners, and a decision to continue, expand or stop.
Timeline	Executive Briefing (30 minutes) › technical validation › scoping and offer › independent baseline typically about 30 days from data readiness › review of effect.
Next step	Request an Executive Briefing at seerene.com/briefing, or forward this page to the executive who owns the decision.
